

OXYLOANS · LENDER GUIDE

How Your First Interest Payment is Calculated

A simple guide every lender should know

The Two Dates That Matter

Every deal has a fixed **monthly interest payment date** — the date on which interest is credited to lenders every month. This date is set when the deal is created and does not change.

When you invest in a deal, your **first payment** covers only the days between your participation date and the next interest payment date. From the second month onwards, you receive a full month's interest on that same fixed date every month.

Why Are 2 Days Excluded?

When counting the days for your first payment, we exclude 2 days — here is the simple reason:

Two days are not counted because:

- 1 Your participation date** — In most cases OxyLoans cannot deploy your funds on the same day you participate. This could be due to bank working hours, late evening or night-time participation, internal processing, or other operational reasons. So your participation date is not counted as an interest-earning day.
- 2 The interest payment date** — On the day your interest is paid out, the payment processing is already under way. That day is also not counted as an interest-earning day.

This ensures that interest is counted only for the days your money is actually deployed and working for you.

Every Month = 30 Days

OxyLoans counts **every month as exactly 30 days** for interest calculation — whether it is January (31 days), February (28 or 29 days), or any other month.

This means your monthly interest is always consistent and predictable. A lender investing ₹20 lakhs at 1.75% always earns exactly **₹35,000 per month** — no more, no less, regardless of the month.

It also means the 31st of any month is treated the same as the 30th for calculation purposes.

The Simple Formula

- Count the days between your participation date and the interest payment date (using 30-day months), then **subtract 2** (your participation day and the payment day are both excluded).

$$\text{Days} = (\text{Payment Date} - \text{Participation Date}) - 2$$

- Calculate your monthly interest.

$$\text{Monthly Interest} = \text{Investment} \times \text{Monthly Rate} \div 100$$

- Divide by 30 to get one day's interest.

$$\text{Daily Interest} = \text{Monthly Interest} \div 30$$

- Multiply by the number of days counted in Step 1.

$$\text{First Payment} = \text{Daily Interest} \times \text{Days}$$

Examples ₹20 Lakhs invested at 1.75% per month

Example 1 Invested on 5 Aug · Interest payment date: 5 Sep (cross-month)

Investment Date	Payment Date	Investment	Monthly Rate
5 Aug 2026	5 Sep 2026	₹20,00,000	1.75%

Sep 5 – Aug 5 = 1 month = **30 days** (30/360 rule)

Subtract 2 (participation day + payment day) → **28 days counted**

Monthly interest = ₹20,00,000 × 1.75% = ₹35,000

Daily interest = ₹35,000 ÷ 30 = ₹1,166.67

First payment = 28 × ₹1,166.67 = **₹32,667**

First payment on 5 Sep

From Oct onwards: ₹35,000 every month on the 5th

₹32,667

Example 2 Invested on 15 Aug · Interest payment date: 31 Aug (same month)

Investment Date	Payment Date	Investment	Monthly Rate
15 Aug 2026	31 Aug 2026	₹20,00,000	1.75%

31st treated as 30th (30-day rule) → 30 – 15 = **15 days**

Subtract 2 (participation day + payment day) → **13 days counted**

Monthly interest = ₹35,000 · Daily interest = ₹1,166.67

First payment = 13 × ₹1,166.67 = **₹15,167**

First payment on 31 Aug

From Sep onwards: ₹35,000 every month

₹15,167

Example 3 Invested on 3 Sep · Interest payment date: 30 Sep (same month)

Investment Date	Payment Date	Investment	Monthly Rate
3 Sep 2026	30 Sep 2026	₹20,00,000	1.75%

30 – 3 = **27 days** in the same month

Subtract 2 (participation day + payment day) → **25 days counted**

Monthly interest = ₹35,000 · Daily interest = ₹1,166.67

First payment = 25 × ₹1,166.67 = **₹29,167**

First payment on 30 Sep

From Oct onwards: ₹35,000 every month on the 30th

₹29,167

Example 4 Invested on 1 Feb · Interest payment date: 28 Feb — February = 30 days, not 28

Investment Date	Payment Date	Investment	Monthly Rate
1 Feb 2027	28 Feb 2027	₹20,00,000	1.75%

Actual calendar days in February = **28 days**

OxyLoans 30/360 rule: every month = **30 days** — so the full month of February is also 30 days

Subtract 2 (participation day + payment day) → **28 days counted**

Monthly interest = ₹35,000 · Daily interest = ₹1,166.67

First payment = $28 \times ₹1,166.67 = ₹32,667$

First payment on 28 Feb · Same result as any full month in any other month

February's shorter calendar does not reduce your interest — you always earn on ₹32,667 30 days

Common Questions

Q. Why is my first payment smaller than my usual monthly interest?

Because your first payment covers only the days between when you invested and the next fixed interest payment date — not a full month. From the second month onwards you receive the full amount every month.

Q. What is the monthly interest payment date?

It is the fixed date on which OxyLoans credits interest to all lenders in that deal. This date is the same every month throughout the deal. For example, if the payment date is the 30th, you receive interest on the 30th of every month.

Q. Why does February also use 30 days?

OxyLoans uses the 30/360 convention — every month is treated as 30 days so that interest is consistent and fair for every lender regardless of which month they invest in. February's shorter calendar does not reduce your interest.

Q. Is my money earning interest from the day I invest?

In most cases OxyLoans is unable to deploy funds on the very same day you participate — due to bank working hours, late evening participation, or other processing reasons. Your funds are deployed as soon as possible thereafter, and the 2-day exclusion fairly accounts for both the participation day and the payment day.

Q. If the payment date is the 31st, do I lose a day?

No. The 31st is treated as the 30th in our 30/360 calculation, so it has the same value as the 30th. You do not lose any interest.
